OTHER NEWS TO NOTE

Rockwell Medical Technologies Inc., of Wixom, Mich., said data on its lead drug candidate soluble ferric pyrophosphate (SFP) showed that all available iron present in SFP was delivered to both iron-binding sites on human apo-transferrin, rapidly and completely. Further, 50 percent of iron uptake was complete within one minute, while there was approximately 90 percent saturation of the iron-binding sites on transferrin, the blood plasma protein for iron ion delivery, within 10 minutes. Data were presented at the American Society of Nephrology annual meeting in San Diego.
